## ENGINEERING AND DESIGN ADVICE NOT AVAILABLE

### IMPORTANT

We don't offer engineering or design advice. We are a supplier of engineering parts. Please refer all enquiries relating to design and engineering to an engineer.

We will happily assist you with information about our products to the best of our ability, but we are not engineers and we do not offer a design service. The information we can provide is limited to the characteristics of the product and not general engineering information such as properties of the materials, determining fits, information relating to ratios and pitches etc. We do sometimes have access to general information and we will assist you where possible, but please don't be offended if we don't have the information you require.

### Examples of what we can and can't advise

- We will tell you what a product is made from, but we won't tell you whether that material is suitable for your application.
- We will tell you the tolerances of an item but we won't suggest what type of fit you need to use or whether the tolerances are suitable for your application.
- We will advise you of any relevant standards to which a product is manufactured but we can't provide copies of the standards or assist in interpreting the standards.
- We will advise you of listed dimensions but we won't advise you of how to calculate related dimensions.

If you are unable to determine the suitability of a product or need assistance with calculations you will need to consult an engineer. We recommend that all product is checked by the purchaser and their engineering consultant for accuracy and conformity to the specifications prior to installation in any application, and all product being used in a new application should be tested for suitability prior to being designed into the application.
