FLEXIBLE SHAFTS

We have a range of flexible shafts in standard steel or stainless steel with coupling ends or panel mounts. Flexible shafts allow for the transmission of shaft revolutions for misaligned shafts and around bends.

They come with two types of end for coupling directly to another shaft or for mounting on a panel. Panel mounting types leave a rigid shaft protruding from the other side of the panel which can then be coupled to your equipment.

There are open types where the shaft cable is exposed, and closed types where the cable is inside a vinyl casing. Exposed types can be used in applications where there is no danger objects becoming entangled in the rotating shaft, whilst closed types provide a measure of safety.

For full details including technical data sheets just type "Flexible Shaft" into the category search box top right of every page on our web site...
