SHAFTLOC® Component Fasteners

A Superior Way to Fasten Rotating Components

Excelling because of its simplicity, it contains all structural features in only two parts. Shaftloc® is the convenient way to lock rotating components such as hubless gears, pulleys, cams or any thin walled components to shafts. They come in imperial and metric sizes.

They feature infinite radial and axial adjustments and quick lock and release action. Due to its asymmetrical thread geometry a large radial clamping force is produced when the nut is tightened. They are precision dynamically balanced and suitable for high speed applications. Tightening the nut causes the slotted sleeve to contract, gripping the shaft and clamping the part to the sleeve. No need for keyways or screws.

Distinct Advantages of Shaftloc®

- Simplicity of design - few parts
- No marring of shafts
- Easy repositioning or synchronizing of rotating components
- Ease of assembly
- Installed in seconds reducing assembly costs
- Applicability to small shaft diameters
- Availability in all stainless steel construction
- Ability to be used for stationary breadboard or production structures
- Low cost
- Reusable and non marring to the shaft

To find Shaftloc® Sleeves on the HES website just use the search box at the top right of any page.
