Skate Bearings

There is a lot of hype on the Internet about skate bearings, much of it suggesting that skaters require high precision bearings in order to get the best performance.

Precision has nothing to do with the performance of a bearing in an application as rough as skating. Skating is very harsh on bearings, so it is important that you determine what your customer wants from their skating before recommending a bearing.

If you want speed you require free running bearings

- Increased internal clearance
- Low viscosity oil lubricant

If you want longer life you require a more impact resistant bearing

- Synthetic cage
- Grease lubricated

If you like to skate in wet or dirty conditions you need to consider

- Stainless Steel bearings
- Seals instead of shields

MBA offers options for all of these requirements, but most importantly you should know that there is no single bearing that will handle all of the above conditions and the ABEC precision of the bearing will not make any difference.
